The present invention relates to a method for stiresponse. The method comprises administering an iacid to a non-rodent subject in sufficient quantiimmune response. The present sequence is one such nucleic acid. The immunostimulatory nucleic acids (py-rich) or thymidine (T) rich. The method is us against tumour antigens, viral antigens (e.g. her and/or orthomyxoviridae), bacterial antigens (e.g. her and or orthomyxoviridae), bacterial antigens (e.g. her and or orthomyxoviridae) and/or parasitic also useful for preventing cancer, asthma, infectimmune deficiency. The present sequence can also Th2 to a Th1 immune response and to activate immu present sequence and have, a phosphorothicate back Sequence 30 BP; 0 A; 30 C; 0 G; 0 T; 0 U; 0 Other imment Scores:	; imilari l Simil. ch: -776-2 139 Pr

```
The invention relates to determining an analyte in a sample comprising

(a) providing a target nucleic acid comprising a region A, a nucleobase
sequence B, where the nucleobase sequence B is not specific for the
sequence B, where the nucleobase sequence B is not specific for the
analyte, and the region A specifically binds to the analyte, (b) binding
the target nucleic acid from the remaining part of the analyte bound to
the target nucleic acid from the remaining part of the sample, (d)
hybridising a primer to the target nucleic acid, where the primer
comprises a nucleobase sequence B, and the nucleobase sequence B,
hybridises to the nucleobase sequence B, and the nucleobase sequence B,
hybridises to the nucleobase sequence B, where at least 30 % of the
comprises an uncleobase sequence B, and the nucleobase sequence B,
hybridised contain at least one promiscuous base which is capable of
base pairing with each of adenine, quanine, cytosine, and thymine, (f)
separating the target nucleic acid from the elongation product B, (g)
hybridising a further primer which comprises the nucleobase sequence B,
to the elongation product B, where the elongation product E is capable of
acting as a template for the elongation of the further primer (c)
elongating the hybridised further primer of step (g) to produce an
elongation product B, where at least 30 % of the nucleotides contain at
least one promiscuous base. (i) separating the elongation
product E, (k) elongating the further primer of step (j) to produce
contain a least one promiscuous base. (i) separating product
content elongation product E using the target nucleic acid or elongation
product E, (k) elongating the further primer of step (j) to produce
content elongation product E using the target nucleic acid or elongation
product E, (k) elongating the further primer of step (j) to produce
content elongation product E using the target nucleic acid or elongation
product E as a template and using nucleotides, where at least 30 % of the
nucleotides contain at least one promi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Determining an analyte in a sample, for generating multiple double stranded nucleic acids, comprises employing a single primer sequence with a nucleobase sequence having affinity to the sequence contained in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           optionally repeating steps (g) - (l) a sufficient number of times to generate a desired amount of double stranded nucleic acids and (n) determining the elongation product E and/or elongation product E as a measure of the presence or amount of the analyte, where the lengths of the sequence I and the nucleobase sequence B are chosen such that, when the further primer hybridises to the elongation product E in step (g),

Determining an analyte in a sample, for generating multiple double stranded nucleic acids, comprises employing a single primer sequence with a nucleobase sequence having affinity to the sequence contained in a
             hybridised primer of step (e) and overlaps at least a part of the 3' region of the hybridized primer of step (e) by an overlap length. The method is useful determining an analyte in a sample. In particular, the method is useful for generating multiple double stranded nucleic acids. The present sequence is a primer molecule used to exemplify the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to determining an analyte in a sample comprising (a) providing a target nucleic acid comprising a region A, a nucleobase sequence B, and a sequence I linked to the 5' terminus of the nucleobase sequence B, where the nucleobase sequence B is not specific for the analyte, and the region A specifically binds to the analyte, (b) binding the target nucleic acid from the remaining part of the sample, (d) hybridising a primer to the target nucleic acid where the primer comprises a nucleobase sequence B', and the nucleobase sequence B', hybridises to the nucleobase sequence B', election the primer to produce an elongation product E using the target nucleic acid primer to the target nucleic B', and the nucleobase sequence B' and the nucleobase sequence an elongation product E using the target nucleic acid as a template and using nucleocides, where at least 30 % of the nucleotides contain at least one promiscuous base which is capable of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            double stranded DNA generation; promiscuous base;
further primer spans a sequence formed by elongation of the

base pairing with each of adenine, guanine, cytosine, and thymine, (f) separating the target nucleic acid from the elongation product E, (g) hybridiahing a further primer which comparises the nucleobase sequence B, c to the elongation product E, where the elongation product E is capable of acting as a template for the elongation of the further primer, (h) c acting as a template for the elongation product E is a template and elongation product E is a template and closing nucleotides, where at least 30 % of the nucleotides contain at elongation product E, (j) separating the elongation product E E from the elongation product E, (j) hybridising a further primer comprising a nucleobase sequence E to the target nucleic acid or the elongation product E, (k) elongating the further primer of step (j) to product E another elongation product E using the target nucleic acid or elongation product E as a template and using nucleotides, where at least 30 % of the nucleotides contain at least one promiscuous base, (l) separating product E of step (k) from the target nucleic acid or elongation product E. (m) coptionally repeating steps (g) - (l) a sufficient number of times to determining the elongation product E and/or elongation product E as a contain at least one promiscuous base, (l) separating steps (g) - (l) a sufficient number of the presence or amount of double stranded nucleic acids and (n) determining the elongation product E in step (g), the further primer spans a sequence B are chosen such that, when the further primer spans a sequence formed by elongation of the hybridised primer of step (e) by an overlap length. The method is useful determining an analyte in a sample. In particular, the method is useful determining an analyte in a sample. In particular, the invaries of the primer of step (e) by an overlap incleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     the invention

The invention describes a method of screening (M) for a transdominant intercellular bloactive agent capable of altering phenotype of a cell, comprises a different motecular library of randomised candidate comprises a different motecular library of randomised candidate comprises a different motecules, where each of the mucleic acids into several cells, where each of the mucleic acids into several cells, where the altered phenotype is due comprises a different motecules with which the bioactive agent. The bioactive agent or the motecules with which the bioactive agent into any cuseful in: cancer applications by introducing random libraries into any cuseful in: cancer applications by introducing random libraries into any cuseful in: cancer applications by introducing random libraries into any cuseful in: cancer applications or decreased cell growth; for screening of bioactive agents which restore the constitutive function of the brca-1 or bioactive agents which restore the constitutive function of the brca-1 or broactive agents which restore the constitutive function of the brca-1 or cardiomyocytes, for enhanced contractile properties of cardiomyocytes and claminished heart failure potential and is useful in neurobiology, immunobiology, arrhythmias, treatment of stroke, enfections disease, bone, inflammation, allergic response, confections disease, bone, inflammation, allergic response, confections disease, bone, inflammation, allergic response, confections and drug resistance applications. (M) allows rapid screening the readom oligomucleotides and their corresponding carpensis, obesity and skin biology applications, in drug carpenning the same cells, without rendom oligomucleotides to cells and stroke method allows seriening is accomplished. In whito the method allows seriening is accomplished. In addition, the method allows screening the absence of significant prior characterisation of the cellular defect. This sequence represents an oligomucleotide used for creating peptides used in the control of signal pathwa
                                                                                                                                                                                                                                                                                        Screening for transdominant bioactive agents capable of altering phenotype of a cell, by introducing library of randomized candidate nucleic acids into several cells and selecting cells exhibiting altered
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 30 BP; 0 A; 20 C; 0 G; 10 T; 0 U; 0 Other;

The present sequence is that of a 30-mer homopolydeoxycytidine. This is an example of antiviral phosphorothioate oligonuclectides of the invention ADF82757-ADF82773 that are used in claimed pharmaceutical compositions for inhibiting the replication of a retrovirus, particularly HIV-1 or HIV-2. The antiviral phosphorothioate oligonuclectides optimally have a chain length of 32-50, especially 36-40, nucleotides, and may
                                                                                                                                                                                                                                      New pharmaceutical composition comprising an oligonucleotide having a phosphorothioate inter-sugar linkage, useful for inhibiting the replication of a retrovirus, particularly HIV-1 or HIV-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Target gene; DNA purification; hybridization; cloning; DNA library;

The invention relates to a method of extracting a target gene. The method involves mixing particles having a probe DNA bound to its surface, a single-stranded bridge oligomuclectide having at one side a sequence complementary to the probe DNA and at the other side a sequence complementary to a part of a base sequence of target gene and a sample containing target gene to be extracted, and hybridizing the probe DNA, the single-stranded bridge oligomucleotide and the target gene. The method is useful for extracting, separating, purifying and detecting target DNA from gene. cloning and cDNA libraries. The method of extracting target DNA trom gene. cloning and cDNA libraries. The method of extracting simple and easy. The target DNA can be extracted accurately and efficiently without being influenced by the configuration and size of the target gene, and the screening process can be accomplished within 24 hours. This sequence represents a probe used in the examples of the

This invention represents a novel cosmetic or pharmaceutical composition for treating epithelial covering tissue which comprises superstructure-
forming nucleic acid sequences. The composition can also be used in
fabric softeners, hand-washing products. Dody and hair care products,
hair dyes or manual dishwashing products. The superstructures are G
quadruplexes, frayed wires or i motifs. The sequences are 30-40

cucleotides long, have five or more C, G or I nucleotides in tandem, no
cyc motifs, no nonmethylated CG dinucleotides, are polyI, polyC or polyG

cyc motifs, no nonmethylated CG dinucleotides, are polyI, polyC or polyG

cyc motifs, no nonmethylated CG dinucleotides, the possphorothicate or
cyc motolymers and are optionally modified by replacing phosphorale, phosphoramidate, phosphorate, phosphoramidate, phosphorate or
cyc pentopyranoses or 3'5'-carbocyclically bridged 2'-deoxyribose
composition of the invention inhibits the release of IL-8. The
composition is useful for preventing or treating inflammatory changes to
epithelial covering tissue, including changes caused by pathogens,
composition is useful for preventing or treating inflammatory changes to
epithelial covering tissue, including changes caused by pathogens,
ceptithelial yearn processes, psoriasis, atopic eczema, dry skin, alopecia
areata, vitiligo, bullous diseases, rejection reactions, sunburn and
configurations in the processes and processes and prince oligonucleotide
composition is a phosphorothioate oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cosmetic or pharmaceutical composition for treating epithelial covering tissue comprises superstructure-forming nucleic acid sequences.

non-toll like New teleost-derived antimicrobial non-scavenger Receptor A, non-toll l receptor polypeptide, useful for treating a disorder resulting from a microbial infection and/or reducing antibiotic resistance.

Disclosure; SEQ ID NO 1; 84pp; English.

The invention provides an isolated antimicrobial non-scavenger receptor A, non-coll like receptor polypeptide having a molecular weight of about C. 2-30 kDa and having properties selected from; (a) (i) being obtainable from a teleost, e.g. catfish (Ictalurus punctatus), mammalian macrophages, (ii) binds to oligoguanostine, [iii] comprises Se basic amino acids selected Lye and Arg, (iv) comprises 50 hydrophobic comprises 50 polar amino acids selected from Ana, ile, Leu, Phe, Trp and val, and (v) comprises 50 polar amino acids selected from Ana, ile, Leu, Phe, Trp and val, and (v) comprises 50 polar amino acids selected from Ana, ile, Leu, Phe, Trp and val, and (v) catfish North-1) According and conditions and acids selected from and acid residues [160, 118, 27-51, 183-195, or 173-50] of the catfish nonspecific cytotoxic cells antimicrobial protein-1 Congrises under stringent conditions to the opposite strand of a catfish North-1 nucleic acid molecule Accorded by a nucleic acid molecule acid molecule Accorded by a nucleic acid molecule acid molecule Accorded acid molecule Accorded by a nucleic acid molecule acid accorded by a nucleic acid accorded by a nucleic acid accorded by accorded accorded by a nucleic acid acid accorded accorded by a nucleic acid acid accorded by a nucleic acid according the arminicarobial acid by accorded a nucleic acid acid molecules acid molecules acid molecules acid molecules acid mole to reduce antibiotic resistance. The polypeptide is present in an amount effective to inhibit microbial growth, e.g. bacterial, protozoa or fungal growth in a subject, e.g. a mammal (human), or in an amount sufficient to reduce antibiotic resistance. The present sequence is that of phosphodiester oligodeoxyguanosine Po dG30. Pretreatment of J774 cells with Po dG30 has been shown to inhibit Escherichia coli DNA,

```
The invention relates to a method (MI) for detecting a short tandem repeat polymorphism (STRP), by amplifying genomic DNA having STRPs, hydridizing colorimetric-labeled oligonucleotides which target for excovering remaining labeled target material from hybridized product, hybridizing recovered material to microarray with oligonucleotide probes complementary to target material, measuring colorimetric intensities of hybridized material and control samples to quantify STRPs. Also described: (1) a kit (K1) to detect a mutation indicative of fragile x syndrome; and (2) a kit (K2) to detect a mutation indicative of STRP. (MI) is useful for detecting STRPs such as fragile X syndrome; and (2) a kit (K2) to detect a mutation indicative of STRP. (MI) is useful for detecting STRPs such as fragile X syndrome (MI) is useful for diagnosing inherited or sporadic genetic defects caused by STRPs. (MI) provides an accurate, highly sensitive, straightforward and reliable process for detecting STRPs. The present sequence represents a probe used to hybridize human FRASA target oligonucleotides, which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Detecting short tandem repeat polymorphism, by hybridizing labeled coligonucleotides that targets short tandem repeat polymorphism, measuring calorimetric intensities of labeled target material, comparing results with control samples.
lipopolysaccharide and CpG activation of interleukin-12 and nitric oxide production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               polymorphism detection; short tandem repeat polymorphism;

The invention relates to a DNA amplification primer pair for the amplification of at least one short tandem repeat (STR) marker. The primer pair is useful for amplification of an STR marker. DNA fingerprinting a genetically related or unrelated individual or dentification of human DNA samples for verifying transplanted tissues or for single cell genetic profiling in research or therapeutic procedures, cor verifying sample mix-up or contemination and for testing, establishing or verifying paternity, maternity or consanguinity of individuals. The primer pair is also useful for determining the degree of surname, where the DNA sample is isolated from a source chosen from blood cells, fingernail slices, hair follicles, sperm cells, bone marrow cells, tecth, and epithelial cells. The present sequence represents a human Y chromosme short tandem repeat locus DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DNA amplification primer pair e.g. OSU6, OSU10, and OSU13 for amplification of a short tandem repeat marker, DNA fingerprinting genetically related or unrelated individuals, and verifying paternity.
                                                                                                                                                                                                                                                                                                                             OSU75.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0000

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an agent for modifying the C-terminal of a protein comprising an acceptor region with a group capable of binding to a protein through a transpeptidation reaction in a protein translation system, and a modifying region containing a non-radioactive modifier linked to a part of the acceptor region via a nucleotide linker. The modified proteins are useful for detecting protein interaction in nucleic acid interaction in a genes e.g. in genome projects, as well as proteinnucleic acid interaction in large quantities in high-throughput screening when studying biological molecules such as proteins and nucleic acids in genome function or proteome analysis. The modified proteins can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  with

The invention relates to an isolated polynucleotide (I) of the giant black tiger prawn, Penaeus monodon or expressed sequence tags of the pacific white shrimp, Litopenaeus vannemel, ABNS097-ABN172), both containing microsatellites sequences including those P. monodon microsatellite sequences given in GenBank AF077550-AF077598. (I), the complementary sequence or fragment and the encoded polypeptide are useful for mapping of the genome of various species of shrimp. Mapping the genome of penaeus is useful toor determining whether a test shrimp, preferably Litopenaeus vannemei, has a genotype associated with a phenotypic trait such as resistance to Taura Syndrome Virus (TSV) infection. The present sequence is that of a probe, useful in examples of the invention. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                       Giant black tiger prawn; Penaeus monodon; pacific white shrimp;

The present invention describes a method (M) for producing a monodispersed preparation of a polyanionic polymer (PP) larger than 10 monodispersed preparation of a polyanionic polymer (EV) a ligation product (FV) a ligating together cligonuclectides that encode glutamate/aspartate residues, expressing EV in a host cell, and isolating together cligonuclectides that encode glutamate/aspartate residues, expressing EV in a host cell, and isolating to product (P) of EV, where (P) is PP and at least 80% of PP is a pproximately of the same molecular weight. Also described: (1) a contract polypeptide and a recombinant fusion protein (I) comprising a polyanionic polymer and polyanionic polymer polypeptide at aither one end or at both ends of it; (2) a contract polymer (II) conjugate comprising a polyanionic polymer and at least one other nucleotide sequence encoding a polyanionic polymer and cleast one other nucleotide sequence encoding a polyanionic polymer and at least one other nucleotide sequence, where the polyanionic polymer is polyanionic polymer (IV) comprising (III) or a vector that comprises a nucleotide sequence that is larger than 10 kDa; and (6) a recombinantly-produced polyanionic polymer (V) that is of any molecular weight or is larger than 10 kD, and is conjugated to another protein. (I) sequence or administering (I) to the individual. (I) is also useful for delivering an effective amount of a pharmaceutically active agent, a therapeutic and the publes of the polyanion or research purposes. ABZ222045 to ABZ221311 and ABPS6374 to the field of the publes of the polyanion of the publes of the pub represent sequences used in the exemplification of the present Example 1; Page 53; 74pp; English. Producing monodispersed preparation of polyanionic polymer for theral by expressing vector comprising ligation product of oligonucleotides encoding glutamate/aspartate residues in host cell and isolating the product

Example 1; Page 53; 74pp; English.

The present invention describes a method (M) for producing a monodispersed preparation of a polyanionic polymer (PP) larger than 10 kD. (M) involves inserting into an expression vector (EV) a ligation product formed by ligating together oligomuclectides that encode glutamate/aspartate residues, expressing EV in a host cell, and isolating competent oligomuclectides that encode glutamate/aspartate residues, expressing EV in a host cell, and isolating competent product (P) of EV, where (P) is pp and at least 80% of PP is approximately of the same molecular weight. Also described: (1) a captroximately of the same molecular weight a polyanionic polymetric another the polyanionic polymer and comprise polyanetic acid; (1) a vector (III) comprising a polyanionic polymer and comprises a nucleotide sequence encoding a polyanionic polymer and comprises a nucleotide sequence encoding a polyanionic polymer is comprised and or polyapartic acid; (4) production of (I); (5) a cell (V) comprising (III) or a vector that comprises a nucleotide sequence that is larger than 10 kDa; and (6) a recombinantly-produced polyanionic polymer (V) that is of any molecular weight or is larger than 10 kD, and is conjugated to another protein. (I) is useful for treating a disease on allment in an individual by the administering (I) to the individual. (I) is also useful for delivering an administering and sease on allment in an individual by the second or polyanion or a shall for treating a disease or allment in an individual and a second or polyanion. effective amount of a pharmaceutically active agent, a therapeutic protein or a drug to a patient in need of it, or for dagnostic and testing or research purposes ABZ22015 to ABZ22131 and ABP56374 to ABP56400 represent sequences used in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                ð
                                                                                                                                                                           유
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a method (M) for producing a monodispersed preparation of a polyanionic polymer (PP) larger than 10 kN involves inserting into an expression vector (EV) a ligation product formed by ligating together oligonucleotides that encode glutamate/aspartate residues, expressing EV in a host cell, and isolating the product formed by ligating together oligonucleotides that encode glutamate/aspartate residues, expressing EV in a host cell, and isolating the protein product (P) of EV, where (P) is pp and at least 80% of EP is a percent fusion protein (I) comprising a polyanionic polymer and another polypeptide at either one end or at both ends of it; (2) a nother polypeptide at either one end or at both ends of it; (2) a collyanionic polymer (II) comprises a nucleotide sequence encoding a polyanionic polymer and ieust new other nucleotide sequence encoding a polyanionic polymer is polyglutamic acid or polyaspartic acid; (4) production of (I); (5) a cell least one other nucleotide sequence encoding a polyanionic polymer is polyglutamic acid or polyaspartic acid; (4) production of (I); (5) a cell least one other nucleotide sequence encoding a polyanionic polymer is polyglutamic acid or polyaspartic acid; (4) production of (I); (5) a cell that encodes a polyanionic polymer (V) that is of any molecular weight or is larger than 10 kD, and is conjugated to another protein. (I) a useful for treating a disease or ailment in an individual by administering (I) to the individual. (I) is also useful for delivering and testing or research purposes ABZ22045 to ABZ2211 and ABBS6374 to ABZ2211 to the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Producing monodispersed preparation of polyanionic polymer for therapy, by expressing vector comprising ligation product of oligonucleotides encoding glutamate/aspartate residues in host cell and isolating the

relevant target molecule that correlates to a phenotype of interest. The method involves determining protein-ligand interactions between a target coandidate and a library of perturbagens and performing a phenotypic assay to determine physiologically relevant perturbagens. The method of the invention results in fewer false positive results than prior art methods and can be used in drug development. The present DNA sequence represents a PCR primer used to amplify the gene sequence of the human telomerase catalytic subunit (HTBRI)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A new method for identifying a physiological target molecule that correlates to a phenotype of interest involves using a library of putative perturbagen probes against target molecules, and is useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; protein-ligand interaction; PCR; primer; ss; OVT1561; HTERT;

This sequence corresponds to a probe to detect a gene that is differentially expressed and detected by the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relate to a method of diagnosing (M1) non-blood disease such as solid tumor by providing peripheral blood sample of human having non-blood disease, and comparing an expression profile of specific genes in the peripheral blood sample to reference expression profile of the genes, where each of the genes is differentially expressed in peripheral blood mononuclear cells (PBMGs) of patients having the disease as compared to PBMGs of normal humans. The method is useful for diagnosing non-blood disease such as solid tumor. The solid tumor is chosen from peripheral blood sample comprises enriched PBMGs. The peripheral blood sample (claimed). (M1) is useful for identifying sense that are differentially expressed in peripheral blood samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Diagnosing non-blood disease such as solid tumor, involves comparing differential expression profile of specific genes in peripheral blood sample of subject with reference expression profile of specific genes.

The primers AAT09303-4 were used to amplify sequence encoding the heavy chain variable region from the murine anti-protein C monoclonal antibody the chain variable region from the murine anti-protein C monoclonal antibody HPC-4, using a first strand cDNA as template. This primer consists of a poly(dC) tail which matches the poly(dG) tail added to the first cDNA. With primer AAT09305, this primer was used to amplify the encoding the HPC-4 light chain variable region. HPC-4 recognises the activation peptide region (AAR98106) of the heavy chain of protein C, a vitamin K-dependent plasma protein zymogen. Protein C is converted to activated protein C, a vitamin R-dependent plasma protein zymogen. Protein C is converted to activated cut in peptide sequence. HPC-4 prevents protein C within the activation peptide sequence. HPC-4 prevents protein C cativated within the activation of phiding to this region. The DNA sequences encoding the variable regions of the heavy and light chains of the antibody (AAT09299-302) were used to construct humanised antibodies using the PCR primers AAT09303-9. The humanised antibodies are useful as inhibiting coagulation and can be used for the treatment of tumours by inhibiting the anticoagulant activity of APC by preventing conversion of protein C
Calcium-binding monoclonal antibody immunoreactive with Protein C - inhibits Protein C anticoagulant activation by thrombin-thrombomodulin, e.g. for treating tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    6,0000

The invention relates to a new isolated polynucleotide. The polynucleotide is useful for diagnosing a CRP variant-detectable disease, for monitoring disease progression or treatment efficacy or relapse of a CRP variant-detectable disease or for selecting therapy for a CRP variant-detectable disease, or myocardial infarction, coronary artery disease, non-fatal or fatal stroke, peripheral vascular disease, congestive heart failure or sudden cardiac death. The present sequence represents a human C-reactive protein, pentraxin-related (CRP) associated
                                                                                               Cardiant; Cerebroprotective; Vasotropic; Dermatological; Antiarthritic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polynucleotide, useful for diagnosing a CRP variant-detectable disease, disease or for selecting therapy for a CRP variant-detectable disease, e.g., myocardial infarction, coronary artery disease.
                                                             Human C-reactive protein (CRP) associated marker DNA SEQ ID NO 847.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Z, Ayalon-Soffer M, Cojocaru GS;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (COHE/)
The present invention relates to loblolly pine polynucleotides with one or more Simple Sequence Repeats (SSRs) (see AAA74205-A74122). The present sequence is one such SSR repeat. SSRs are also known as microsatellite DNA repeats. The SSRs are useful as genetic markers for genetic mapping, population genetics studies and inheritance studies in various plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polynucleotide having simple sequence repeat useful as markers in plants for genetic characterization e.g. genetic mapping study, an inheritance study of a commercially important trait in a plant breeding program.
                                                                                                                                                                                                                                                                    Loblolly pine; Simple Sequence Repeat; SSR; microsatellite DNA repeat; genetic marker; mapping; inheritance study; population genetics study; plant breeding programme; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            8

                                                                                                                                                                                                                                        The present invention relates to estimating the number of nucleotide repeats and determining the presence of other genetic element(s), such as repeats and determining the presence of other genetic element(s), such as arrived in incobial typing, by ligating the oligonucleotide(s) annealed to the nucleic acid sample to each other using a ligation or reaction has occurred. Specifically, analyzing the number of repeats in a semple comprises providing a nucleic acid sample potentially comprising a repeat, providing oligonucleotide(s) complementary to the repeat; annealing the oligonucleotide(s); ligating the oligonucleotide(s) annealed to the nucleic acid sample to each other using a ligase enzyme; converting a ligation by-product into ATP; and detecting the ATP by a luciferase-based assay to determine whether a ligation reaction has courside the repeated sequence. The oligonucleotide employed is a mono-, di-or multimer of the repeat in itself. The oligonucleotides are complementary to, but that are out of phase with, the repeat. Unannealed oligonucleotides are removed after the detection by using an exonuclease, and are inactivated after the detection by using an exonuclease, and Acoppe' modification, that is informative for identification of misatellites where, the nuclear tibosomal DNA (FDNA) spacers (TSU) (185). Type, xrpB and groeE, microsatellite and misatellites, whise, the nuclear tibosomal DNA (FDNA) spacers (TSU) and ITSD. The method is useful in diagnosing dentatorubral cubming the attain and ITSD. The method is useful in diagnosing dentatorubral cubming and phosphata and internal transcribed ribosomal DNA (FDNA) spacers (TSI) and ITSD. The method is useful in diagnosing dentatorubral entry of a genetic region, pring an atrophy (DRPLA), Franche Complementary to a genetic region of the present complementary and prince shall and ITSD. The method is useful in diagnosing dentatorubral shaful of Apprency of the present of seminance of a DNA servence of the present of the present of the present of the present o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          sequence is a DNA sequence comprising CGG repeats useful for detection of
                                                                                                                                       Determining the presence of genetic element(s), e.g. nucleotide repeat(s), or marker(s) for microbial typing, in a nucleic acid samuseful in diagnostic methods, by performing a ligation reaction and detecting a ligation by-product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     7,0000

The sequences given in AAQ41905-10 are triplex-forming oligonucleotides (TFO) which are specific to the promoter region of erb B2/neu. They bind conto the major groove of the DNA duplex to form a triplex. The TFOs are complementary to the target sequence such they include a G when the complementary location in the DNA duplex is a GC pair and T when the complementary location in the BNA duplex is a GC pair and T when the complementary location in the DNA duplex is a GC pair and T when the complementary location in the BNA duplex by a man T base pair. The target purine or pyrimidine bases. The long purine run in the erb B2/neu complementary protein-NNA polymerase interaction. Further inhibition of the protein binding at the CAT box site can also block the interaction of the protein binding at the CAT box site can also block the interaction of the CAT protein with TFIId at the TATA box. The sequences given in AAQ41911-13 are control isomers which comprise randomised sequences based on TFOs which do not bland to the erb B2/neu (HER-2) gene is the human ceffect on erb B2/neu expression. The erb B2/neu (HER-2) gene is the human ceffect on erb B2/neu expression. The erb B2/neu (HER-2) gene is the human two longue of the ran neu gene. This human homologue is frequently amplified in trumpurs. When expressed at high levels in NIB13 cells, erb B2/neu is strongly transforming and results in a high incidence of mammary tunnours in transgenic mice. The core promoter element of erb B2/neu seiton on the presence of cell growth factors such as TPA, c-AMP and retinic acid. Therefore, overexpression of of erb B2/neu way be one ere baz/neu promoter region by the TFOS may be used to inhibit expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Use of triplex-forming oligo-nucleotide - to inhibit proliferation of cells contg. an erb. B2/neu gene site, for treating cancers, psoriasis

```
AAQ88045 is a ds probe which corresp. to bases -68 to -19 on the HBR2/c-erb B2/neu proto-oncogene. It contains a homopurine/homopyrimidine tract involved in triplex formation. The CU-rich (AAQ88044) RNA sequences corresp. to pyrimidine (parallel) or purine (antiparallel) third strand triplex binding motifs respectively. The CU-rich RNA was generated in vitro from a pBluescript deriv. in which the multicloning site was replaced with a 28 bt synthetic oligo duplex. When linearised with Sstl and transcribed by T3 RNA polymerase the transcript AAQ88043 was generated. When linearised with KpnI and transcribed by T7 RNA polymerase in the opposite orientation, the corresp. antisense GA-rich strand was generated. Both transcripts also contained approx. 12 nts of flanking RNA derived from cloning and the polymerase start sequences. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Constructs having 5'-stabilising and 3'-terminating flanking regions, -for intracellular generation of oligo:nucleotide transcript, useful in gene regulation and therapy.
                                                                                                                                                                                                           CU-rich triplex binding motif for HER2 promoter fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 28 BP; 0 A; 19 C; 0 G; 0 T; 9 U; 0 Other;

```
This sequence is a PCR primer for DNA encoding the human ATG-1709 protein of the invention. ATG-1709 is related to human secreted ligands for 7-Transmembrane receptors and similar to murine BFRP-1. ATG-1709 polypeptides and polynucleotides are useful for diagnosing susceptibility to diseases by detecting mutations in the ATG-1709 gene using probes containing the ATG-1709 nucleotide sequence, and can diagnose diseases associated with ATG-1709 imbalance by determining ATG-1709 polypeptide expression levels. ATG-1709 polypeptides can be used to screen for agonists and antagonists which bind the ATG-1709 polypeptide. These can be used in treatment to activate or inhibit ATG-1709 activity, in addition to direct administration of antisense sequences to prevent expression. ATG-1709 polypeptides to treat conditions associated with a lack of ATG-1709. Gene therapy may also be used to affect endogenous ATG-1709 expression. ATG-1709 antibodies are useful for inducing an angeles of the attention of an used to affect endogenous ATG-1709 antibodies are useful for inducing an are

This sequence represents the triplex forming oligonucleotide HN28ap (the phosphorothioate ester form is known as HN28apPTE), which targets the her 2/neu promoter. This sequence can be used with the polycationic oligomers are of discrete oligomers of the invention. The polycationic oligomers are of discrete classified as repeating structure of formula (I): [(REP)m.(M) r-(REP)m.(M) r-(REP)m.(M)
                                                                                                                                                                                                                                                                                                          New poly:cationic oligomer cell transfection agent(8) - are size-selected for precise neutralisation of nucleic acid charge to facilitate uptake in e.g. cancer cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PCR primers AAV02959-V02977 are used to amplify fragments of the Hepatitis GB virus (HGV) type C gene isolated from the serum of nonB nonC chronic hepatitis patients. These fragments are used in devising a highly sensitive method for the detection of the GBV-C gene using an oligonucleotide which can hybridise with any of these GBV-fragments

                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the

The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lession, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, osler-Webber Syndrome, myocardial angiogenesis plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     angiogenesis in a subject, involves administering at least one
diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibroplasia; rubeosis; Osler-Webber Syndrome; myocardial angiogenesis; plaque neovascularisation; telangiectasia; heemophiliac joint; anglofibroma; wound granulation; intestinal adhesion; atherosclerosis; scleroderma; hypertrophic scar.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antibody-induced cell lysis; cancer; immunostimulatory; CD20; angiogenesis; metastasis; cytostatic; phosphorothioate backbone; ss.

The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psortasis, eczema, allergic contect dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                                                                                                                                               Treating non-allergic inflammatory diseases, such as psoriasis, eczeallergic contact dermatitis, latex dermatitis or inflammatory bowel disease by administering an immunostimulatory nucleic acid.
inflammatory bowel disease; ulcerative colitis; Crohn's disease; ss
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ds, allergy, asthma, poly-G nucleic acid, aerosol formulation, hypo-responsive subject; immunostimulatory.

                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to methods for treating or preventing developing administering to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies. The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder cancer, bone cancer, brain and central nervous system (CNS) cancer, breast cancer, cervical cancer, colon and rectum cancer, connective tissue cancer, oesophageal cancer, eye cancer, kidney cancer, larynx cancer, leukaemia, liver cancer, lung cancer, kidney cancer, larynx cancer, pancreatic cancer, lung cancer, rhabdomna, melanoma, myeloma, oral cavity cancer, overian cancer, stomach cancer, testicular cancer, rhabdomyosarcoma, skin present sequence is an immunostimulatory oligonucleotide described in the
                                                                                                                                                                                                                                                                                                                                              Treating or preventing cancer, such as basal cell carcinoma, comprises administering immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies to a subject having or at risk of

                                                                                                                                                                                                                                                  The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                      sand/or preventing allergy or asthma using an immunostimulatory acid alone or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New pharmaceutical composition comprising an oligonucleotide having a phosphorothioate inter-sugar linkage, useful for inhibiting the replication of a retrovirus, particularly HIV-1 or HIV-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  'note= "OTHER= phosphorothioate nucleotides"

The present invention relates to antiviral phosphorothioate oligonucleotides that are used in claimed methods of inhibiting the replication of a retrovirus, particularly HIV-1 or HIV-2. The antiviral phosphorothioate oligonucleotides have a chain length of 32-50 nucleotides, and may comprise a 3' inverted thymine base. The present sequence is that of a homopolydeoxycytidine of 28-nucleotide chain length. This was used in an example from the invention to determine the optimal nucleotide chain length. Anti-HIV effect was shown to increase in a length-dependent manner, with maximal or total inhibition achieved with phosphorothioate oligonucleotides of 36-40 nucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Suppressing allergies, including asthma, rhinitis, urticaria and atopic dermatitis, in a subject, comprises administering a first and second dose of an immunostimulatory nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of suppressing a symptom of an allergic response in a subject by administering a first and second dose of an immunostimulatory nucleic acid that comprises a nucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ss; antiasthmatic; antiallergic; dermatological; antiinflammatory; antibacterial; virucide; immunoglobulin E antagonist; allergy; immunostimulator; asthma; rhinitis; urticaria; dermatitis; bacterial infection; viral infection.

The present invention relates to a method for augmenting T-helper 1 cells (Th1)-like immune activation in a subject. The method comprises administrating an immunostimulatory nucleic acid (1) to induce Th1-like
comprising 5'-cg-3', and where the second dose is administered from 1 day to 8 weeks after the first dose. The methods and compositions of the present invention are useful for the treatment or prevention of asthma and allergy, including rhinitis, urticaria and atopic dermatitis, using an immunostimulatory nucleic acid alone or in combination with other medicaments. They can also be used in preventing bacterial and viral infections. This sequence represents an oligonucleotide used in the

The present invention relates to a method for inhibiting the proliferation of malignant, dysplastic and/or hyperproliferative cells in a subject, which comprises administering a guanosine rich oligonucleotide (GRO). The present sequence is one such GRO. The present sequence is one such GRO. The present sequence is one such GRO. The present sequence is proliferation of malignant, dysplastic and/or hyperproliferative cells for the treatment of conditions such as cancer e.g. breast cancer, prostate cancer or cervical cancer, or psoriasis

                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to method for determining neoplastic state of a cell, involves detecting the presence of plasma membrane nucleotide in the cell or quantifying the amount of plasma membrane nucleolin in the cell. The invention is useful for diagnosing pre-malignant cells, malignant cells and lung small cell carcinoma. The present sequence is a non-antisense oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                 Determining neoplastic state of cell, involves detecting presence of plasma membrane nucleotide in cell or quantifying amount of plasma membrane nucleolin in cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          00000

The present sequence is that of a guanosine-rich oligonucleotide (GRO), denoted GRO29-3, that can be used in the method of the invention. The method is for the detection of apoptosis. It involves preparing a sample from which cells have been removed, and detecting nucleolin and/or poly(ADP-ribose) polymerase (PARP-I) in the sample, where the sample is blood, serum, plasma, tissue, tissue culture medium or sputum. Detection of fucleolin involves detection of a complex between nucleolin and a nucleolin binding molecule, preferably an anti-nucleolin antibody or a GRO, such as the present GRO. The method allows detection of excessive apoptosis in a subject suspected of having AIDS, a neurodegenerative disease, an ischaemic injury, an autoimmune disease, a tumour, a cancer (especially endocervical adenocarcinoma, prostatic carcinoma, breast cancer, leukaemia and non-emall cell lung carcinoma, a viral infection, an acute inflammatory condition or sepsis (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detecting apoptosis comprises preparing a sample from which cells have been removed and detecting at least one of nucleolin and PARP-I in the
Guanosine-rich oligonucleotide GRO29-3, used in apoptosis detection.

This invention relates to a novel method for treating inflammation in a patient which comprises administering to the patient a composition comprising administering to the patient a composition comprising and (granucleotide). The invention may be useful for the development of compounds with an antiinflammatory.

analgesic, gynecological, hepatotropic, neuroprotective, nootropic, antirthritic, antirhematic, gastrointestinal-Gen. or antiulcer activity whilst the disclosed sequence may prove useful for gene therapy. The methods are useful for treating inflammation associated with an acute inflammatory condition. The acute inflammatory condition is selected from primary dysmenorrhea, acute alcoholic liver disease and acute from parametery disease. The chronic inflammatory clisease is selected from theumation may also be of Alzheimer's disease or associated with a chronic inflammatory disease. The chronic inflammatory clisease is selected from theumatoid arthritis, asthma, gastrointestinal tract disease, psoriasis, atherosclerosis, Crohns disease, ulcerative colliss alcohol, chronic alcoholic liver disease, uncalcoholic colliss active and chronic pancreatitis. The present sequence is that of the oligonucleotide GRO 29-3 which was used during the development of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Treating inflammation, e.g. acute or chronic inflammation such as rheumatoid arthritis, asthma, psoriasis, and atherosclerosis, in a patient comprises administering to the patient a composition comprising

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to treating cancer in a subject comprises administering to the subject a therapeutically effective amount of an anti-nucleolin agent and a carrier. Also included is a pharmaceutical composition comprising a nucleolin antibody or an inhibitory RNA against nucleolin, and a carrier. The method and antibodies, RNA and composition are useful for treating cancer, such as melanoma, lymphoma, plasmocytoma, sarcoma, glioma, thymoma, leukemia, hepatoma, or breast, prostate, colon, liver, esophageal, brain, lung, ovary, or cervical cancer. The present sequence is a GRO (guanine-rich oligonucleotide) which binds to nucleolin
                                                                                              Diagnosis; therapy; tumor; cancer; neoplasm; cytostatic; nucleolin; ss; guanine-rich oligonucleotide; gene silencing; RNA interference; melanoma; lymphoma; sarcoma; glioma; leukemia; hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               inflammation, antiinflammatory; analgesic; gynecological; hepatotropic; neuroprotective; nootropic; antiarthritic; antirheumatic; gastrointestinal-Gen.; antiulcer; gene therapy; dysmenorrhea;

This single-stranded oligonucleotide is one example of an immunostimulatory sequence containing a palindrome. Its sequence, other than the palindromic structure, is a simple repetition of deoxyguanylic acid. This oligonucleotide had the strongest activity to augment NK cell activity of 6 oligos in which the palindrome is flanked by repeated units (see AAQ20870-Q20875)
/*tag= a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This single-stranded oligonucleotide is one example of an immunostimulatory sequence containing a palindrome. Its sequence, other than the palindromic structure, is a simple repetition of deoxycytidine residues. When the oligonucleotide is present at a final concentration of 50 microg/ml, mouse spleen NK cell activity was 16.5 (plus/minus 0.9), cf. 544 (plus/minus 2.4) for a 30mer oligonucleotide in which the same palindromic sequence is flanked by repeated deoxyguanylic acid (see AAQ20870) and 13.3 (plus/minus 0.9) for the control

30-bp polypurine/polypyrimidine site in supFGla (AAT70015), a modified supF gene (see also AAT70005). It was used to test intracellular targetted mutagenesis via triplex formation, using an SV40 vector in vivo in monkey COS cells. Administration of psoralen-linked AGT30 followed after 2 hr by UVA irradiation induced mutations in 2.1% of the vector molecules. There was a high specificity for T:A to A:T transversions at the predicted psoralen intercalation site (bp 166 of supF)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             In an example of the invention, the binding of the oligonucleotides AG10 (AAT47062), AG20 (AAT47061) and AG30 (AAT47060) to the supFG1 triplex target site (AAT47059), was examined using a gel mobility shift assay. Based on the concentration dependence of the triplex formation, the equilibrium constants for AG10, AG20 and AG30 were 3x10 power -5, 3x10 power -7 and 2x10 power -8. The oligonucleotides were then tested for their ability to induce mutations in the pSupFG1 SV40 vector in monkey COS cells. AG30 generated mutations in the target gene at a frequency of 0.27%, 13 fold over the spontaneous background in the assay. In contrast, AG10 and AG20, which show inferior 3rd strand binding to supFG1, were mutations induced in producing mutations. Examples of some of the given in AAT75067-73
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Triplex; supFG1; forming; target site; triple stranded; induction; mutation; targetted mutagenesis; triple helix; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Oligonucleotide AG30, which binds triplex target site in supFG1.

                                                                                                                                                                                                                           AAQ81071 is the supF gene triplex forming mutagenic oligonucleotide pso-AGT30. It forms a triplex (a triple stranded mucleic acid) with a specific acite on the supF genome, enabling the covalently bound 4'hydroxymethyl-4,5',8-trimethylpsoralen group to produce a site specific mutation. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                             ABN81202
                                                                                                                       The invention relates to novel synthetic genes for plant gums. A new approach is described to the production of hydroxyproline-rich glycoproteins (RRRPs) and arabino-galactan proteins (BRRPs) and sarabino-galactan proteins (AAY01267) can be engineered for the production of repetitive glycopeptide modules in cells. The invention provided a new approach to the problem of producing plant gums that is not dependent on environmental factors and greatly simplifies the production of a variety of naturally occurring gums as well as designer gums. Note: The present nucleotide sequence is indicated as a peptide sequence in the claims
                                                                                                                                                                                                                                                                                                                                             Synthetic gene; plant; gum; hydroxyproline-rich glycoprotein; HRGP; repetitive proline-rich protein; RPRP; arabino-galactan protein; AGP;

black tiger prawn, Penaeus monodon or expressed sequence tags of the pacific white shrimp, Litopenaeus vannemei (ABN80197-ABN801172), both containing microsatellites sequences including those P. monodon microsatellite sequences given in GenBank AR077550-AR077559. (I), the complementary sequence or fragment and the encoded polypeptide are useful for mapping of the genome of various species of shrimp. Mapping the genome of Penaeus is useful for determining whether a test shrimp, preferably Litopenaeus vannemei, has a genotype associated with a preferably Litopenaeus vannemei, has a genotype associated with a infection. The present sequence is that of a probe, useful in examples of the invention. (Updated on 06-AUG-2003 to correct OS field.)

The invention relates to novel fusion proteins comprising a heterologous polypeptide fused to a variant (non-wild type) bacteriophage major coat protein (protein VIII). The invention also relates to replicable expression vectors which contain a gene encoding the fusion protein; bost calls containing the expression vectors; phages which display the fusion proteins on viral surfaces; and methods of using these compositions. The fusion proteins incorporated in a major coat proteins can be used to alter functional variants of the major coat proteins can be used to alter functional variants can be used to increase the number of fusion proteins incorporated into a virus particle. Hyper-functional variants can be used to increase the number of fusion proteins incorporated into a virus particle. Conversely, hypo-functional variants can be used to decrease fusion protein incorporation. This is useful for tailoring the incorporation of fusion proteins into virus particles to achieve a desired level of valency. The variant replicable plasmid by highly purifying DNA. The present invention uses affinity DNA colls by highly purifying DNA. The present invention uses affinity DNA purification to reduce ionic impurities and thus reduce the conductance associated with a unit mass of DNA. This is an advantageous in electroporation methods for increasing the concentration of DNA present. The increase in DNA entering the host cell provides a greater number of transformants per electroporation and allows one to prepare larger combinatorial libraries which overcomes the prior art problem of small combinatorial libraries which overcomes the prior art problem of small bribrary size using recombinant DNA. ```
The specification describes a method for modifying a nucleotide sequence in the genome of a cell. The method comprises providing a cell and a DNA-modifying molecule, manipulating the cell to generate a synchronized cell and contacting the synchronized cell with the DNA-modifying molecule cell and contacting the synchronized cell with the DNA-modifying molecule conditions such that a modification in the nucleotide sequence is produced. The method is useful for modifying nucleotide sequence in the genome of a human or non-human cell including a fertilized egg cell from an animal such as sheep, pig, rabbit, cattle and a mouse cell such as and embryonic stem cell. blastcocele, midgestation embryo cell and embryonic stem cell. The cell, blastcocele, midgestation embryo cell and embryonic stem cell. The cell, blastcocele, midgestation embryo cell cetermining the effect of the modification on the genome of a cell for determining the effect of the modification on the cell. The method generates transgenic cells and animals useful as models for diseases, and cetective genes with non-defective genes. Further the method is useful for determining the function of a gene knockout organisms and/or replacement of for determining the function of a gene of unknown function. AAI65861-62
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Modifying nucleotide sequence, including recombination of genes in (non-)human cell, comprises introducing DNA-modifying molecule into cell cycle synchronized cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   of the invention to modify a fragment of the Hprt gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            30
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 30 BP; 5 A; 0 C; 23 G; 2 T; 0 U; 0 Other;
